

Propose-layers — prompts

The model proposes a document-level layer for each document with `needs_verification=true` based on metadata (HITL Gate 2).

System prompt

Tells the model to classify technical documents based on their metadata and purpose.

Placeholders:

- `{layer_block}` — every layer in the ontology rendered as one line `- <name>: <description> (keywords: <k1>, <k2>...)` .

Template:

```
You classify technical documents into exactly one layer based on their
filename, title, and metadata.
```

```
Each layer is defined by a name, description, and optional keywords.
Choose the layer whose description best matches the document's purpose.
```

```
The layers:
{layer_block}
```

```
Reply with ONLY a JSON object: {"layer": "<layer>"}
No other text.
```

User message

The user message provides the document's metadata extracted during ingest.

Template:

```
doc_id: {doc.doc_id}
title: {doc.title}
path: {doc.path}
pages: {doc.pages}
```

```
format: {doc.format_class_dominant}  
language: {doc.language_dominant}
```

Expected output

```
{"layer": "mechanical"}
```
